

Solid State Relays 3-Phase with Integrated Heatsink Types RGC2, RGC3

CARLO GAVAZZI

- 2-pole & 3-pole switching AC solid state contactors
- Product width up to 70mm
- Rated operational voltage: up to 660VAC
- Rated operational current: up to 75AAC
- Control voltages: 5-32VDC, 20-275VAC (24-190 VDC)
- Up to 15,000A²s for I²t
- Motor ratings up to 11 kW @ 400VAC, 25HP @ 600VAC
- Integrated varistor protection on output
- Optional monitoring for SSR and load malfunction (RGC..M)¹
- EMR alarm output and auxiliary output (RGC..M)
- Controlled fan operation for versions with integrated fan
- 100kA Short Circuit Current Rating according to UL508
- DIN or panel mount

1: RGC..M is suitable only for resistive loads
2: Applicable only to RGC...10

Product Description

This product is intended to replace mechanical contactors especially when switching is frequent. The smallest product width in the RGC2, RGC3 range is 54mm (3xDIN) and goes up to 70mm. 2-pole and 3-pole switching options are available.

Apart from resistive and slightly inductive loads, the RGC is certified for motor switching with associated motor ratings. A green LED gives indication of

control voltage presence. Fan operation is controlled for the versions which have an integrated fan. Detection of SSR overheat, mains loss, SSR malfunction and load loss is possible with the RGC..M versions. An EMR alarm output is available for remote signaling. An additional feature with the RGC..M is the electronic auxiliary output. The RGC..M has additional LEDs for load status and alarm status indication.

EMC emission	EN/IEC 60947-4-3*	Radio interference field emission (radiated)	EN/IEC 55011
Radio interference voltage emission (conducted)	EN/IEC 55011	30-1000MHz	Class A (Industrial)
0.15-30MHz	Class A (Industrial) with filters - see filter information		

Note:

- Control input lines must be installed together to maintain products susceptibility to Radio Frequency Interference.
- Use of AC solid state relays may according to the application and the load current, cause conducted radio interferences. Use of mains filters may be necessary for cases where the user must meet E.M.C requirements. The capacitor values given inside the filtering specification tables should be taken only as indications, the filter attenuation will depend on the final application.
- This product has been designed for Class A equipment. Use of this product in domestic environments may cause radio interference, in which case the user may be required to employ additional mitigation methods.
- Surge tests on RGC...A, RGC...A..A.. models were carried out with the signal line impedance network. In case the line impedance is less than 40Ω, it is suggested that AC supply is provided through a secondary circuit where the short circuit limit between conductors or between conductors and ground is 1500VA or less.
- * For conformance to EN/IEC 61000-6-4, an external capacitor class X1, 220nF, 275VAC is to be connected across the input control lines A1-A2 for AC control versions.
- ** With external varistor 275V (S05K275) Type 2 connected between terminals 22 - 21 or terminals 24 - 21.

- Performance Criteria 1 (Performance Criteria A): No degradation of performance or loss of function is allowed when the product is operated as intended.
- Performance Criteria 2 (Performance Criteria B): During the test, degradation of performance or partial loss of function is allowed. However, when the test is complete the product should return operating as intended by itself.
- Performance Criteria 3 (Performance Criteria C): Temporary loss of function is allowed, provided the function can be restored by manual operation of the control.

Filtering - EN/IEC 55011 Class A Compliance

Terminals labelling:

- 1/L1, 2/L2, 3/L3: Mains connections
- 2/T1, 4/T2, 6/T3: Load connections
- A1(+): Positive control signal
- A2(-): Control ground
- Us(+): External supply positive signal
- Us(-): External supply ground
- Us~): AC external supply
- Uf(+): Fan supply positive signal
(no connection required by end user)
- Uf(-): Fan supply ground
(no connection required by end user)
- 12: Alarm EMR, normally closed
- 14: Alarm EMR, normally open
- 11: Alarm EMR, common terminal
- 22: Auxiliary output, normally closed
- 24: Auxiliary output, normally open
- 21: Auxiliary output, common terminal

Connections to Uf+, Uf- are provided readily terminated by manufacturer. However, in case of needed user intervention on terminals Uf+, Uf- for the RGC..A..AF and RGC..A..AFM models, the mains supply has to be turned off first to avoid risk of electrical shock.

Connection Diagram

* Not suitable for use with RGC...M versions

Connection Configuration for Auxiliary Output

Versions: RGC..D..DM, RGC..D..DFM

Auxiliary output signal 24VDC, 50mA; DC control, U_c (5-32VDC); DC external supply, U_s (24VDC)

Connection of normally open auxiliary output (24-21) in a 'pnp' style

Connection of normally open auxiliary output (24-21) in an 'nnp' style

Versions: RGC..D..AM, RGC..D..AFM

Auxiliary output signal 24VDC, 50mA; DC control, U_c (5-32VDC); AC external supply, U_s (90-250VAC)

Connection of normally open auxiliary output (24-21) in a 'pnp' style

Connection of normally open auxiliary output (24-21) in an 'nnp' style

Conection Configuration for Auxiliary Output

Versions: RGC..A..AM, RGC..A..AFM

Auxiliary output signal 90-250VAC, max. 1A @ 25°C; AC control, U_c (20-275VAC); AC external supply, U_s (90-250VAC)

Connection of normally open auxiliary output (24-21) to an AC load

Note: In relation to the auxiliary output terminals 22, 24, 21; it is not possible to connect all 3 terminals to the auxiliary circuit. Preference shall be given to either a normally open (24-21) or normally closed (22-21) contact. The respective terminations shall be choosen and configured accordingly.

RGC..M Mode of Operation

The RGC..M versions are suitable only for use with resistive loads.

The 'M' suffix versions integrate monitoring circuitry that can detect the status of the Mains, Load, and Solid State Relay (SSR) status. The fault conditions that can be detected with the RGC..M include:

- Mains loss
- Load loss
- SSR open circuit
- SSR short circuit
- SSR over temperature

An external supply, 24VDC or 90-250VAC, selectable through part no. configuration, is required for the operation of the RGC..M models. In the case of a fault condition, an EMR alarm output is available through terminals 11, 12, 14 for remote indication. Alarm visual indication is provided by a flashing red LED. The flash rate of the red LED gives an indication of the type of alarm condition detected.

The RGC..M is also equipped with an auxiliary output which operates in synchronisation with the output of the SSR. This electronic auxiliary output with normally open or normally closed user selectable contacts is available through terminals 21, 22, 24. A yellow LED gives indication of the SSR output status.

Mains Loss:

The mains loss alarm is issued if the mains voltage is missing from either terminals L1, L2 or L3 for more than 1 second. This alarm type is indicated by 2 flashes of the red LED. The alarm resets automatically once the mains voltage is restored and is present on terminals L1, L2 and/or L3 for more than 1 second.

	Supply Voltage (Us) Loss	Supply Voltage (Us) Loss	Normal Operation SSR OFF	Normal Operation SSR ON	Mains Loss Detection (> 1s)	Normal Operation SSR ON

<u>Alarm Output, NO (11-14)</u>					■	
<u>Alarm Output, NC (11-12)</u>	■	■	■	■		■

RGC..M Mode of Operation (continued)

Load Loss:

Detection of load loss is possible both with control voltage ON and control voltage OFF. This alarm is issued in the absence of a load termination or an open load on terminals T1, T2 and/or T3 exceeding 120ms. Upon detection of this alarm, the SSR output is switched OFF. This alarm type is indicated by 3 flashes of the red LED. The fault condition is automatically restored once the fault is cleared. As long as the load loss condition is present and an alarm is issued accordingly, other alarm conditions occurring when load loss is still present are ignored. For example, if a mains loss occurs during a load loss alarm condition, such an alarm is not indicated until the load loss is cleared. Only once the load loss is cleared, the mains loss alarm is issued if still present.

	Supply Voltage (Us) Loss	Normal Operation SSR OFF	Normal Operation SSR ON	Load Loss condition (> 120ms) during control ON	Control OFF during Load Loss status	Load restored	Normal Operation SSR ON
<u>Mains Supply (L1, L2, L3)</u>							
<u>Load Supply (T1, T2, T3)</u>							
<u>Load Current</u>							
<u>Auxiliary Output, NO (21-24)</u>							
<u>Auxiliary Output, NC (21-22)</u>							
<u>Supply Voltage (Us)</u>							
<u>Control Voltage (A1, A2)</u>							
<u>Green LED (Control & Supply)</u>							
<u>Yellow LED (Load status)</u>							
<u>Red LED (Alarm LED)</u>							
<u>Alarm Output, NO (11-14)</u>							
<u>Alarm Output, NC (11-12)</u>							

The load loss alarm is not restored automatically in the case of the loads having delta connection. The external supply, Us needs to be re-setted (switched OFF and back ON) to clear the alarm signal.

RGC..M Mode of Operation (continued)

SSR Short Circuit:

This condition is detected when the SSR output remains ON for more than 250ms without control voltage. Upon this alarm, an attempt is made to switch OFF the SSR output but this may not be possible in case of a damaged SSR output(s). Alarm indication is given by 3 flashes of the red LED (same as the load loss alarm indication). In case of a self recovery, the SSR will automatically reset.

During an SSR short circuit condition, the SSR output is ON unintentionally. In this case the auxiliary output does not work in synchronisation with the SSR output.

	Normal Operation SSR OFF	Normal Operation SSR ON	SSR short circuit condition during control OFF (>250ms)
<u>Mains Supply (L1, L2, L3)</u>			
<u>Load Supply (T1, T2, T3)</u>			
<u>Load Current</u>			
<u>Auxiliary Output, NO (21-24)</u>			
<u>Auxiliary Output, NC (21-22)</u>			
<u>Supply Voltage (Us)</u>			
<u>Control Voltage (A1, A2)</u>			
<u>Green LED (Control & Supply)</u>			
<u>Yellow LED (Load status)</u>			
<u>Red LED (Alarm LED)</u>			
<u>Alarm Output, NO (11-14)</u>			
<u>Alarm Output, NC (11-12)</u>			

RGC..M Mode of Operation (continued)

SSR Open Circuit:

This alarm is issued when either one of the poles or all 3 poles do not switch ON within 250ms when control voltage is applied. This alarm type is identified by 4 flashes of the red LED.

Example Condition 1:

Once the open circuit alarm is issued it remains present for 1 minute as long as control voltage is ON. After 1 minute, an attempt to switch ON the SSR is made if control is ON. In case the open circuit condition is still present the alarm is issued again. In the case of an open circuit on only 1 pole the load will switch on 2 phases for 250ms until the open circuit condition on the damaged pole is detected. As soon as the open circuit condition is detected, an alarm is issued and the SSR output is switched OFF. This cycle will repeat for a count of 10 times as long as the control voltage is present. After 10 times no further switch re-attempts are made. It is necessary to reset the external supply (Us) to re-attempt a switch ON. In case failure persists device is to be returned to factory.

Example Condition 2:

Once the open circuit alarm is issued it remains present for 1 minute as long as control voltage is ON. If during this period the control voltage is switched OFF, the alarm is automatically cleared and the count indicated in Condition 1 is also set to 0. If control voltage is re-applied and the open circuit condition is detected an alarm is issued accordingly. After 1 minute, an attempt to switch ON the SSR is made if control is still ON. This will continue for a count of 10 times as long as the control voltage is present. After 10 times no further switch re-attempts are made. It is necessary to reset the external supply (Us) to re-attempt a switch ON. In case failure persists device is to be returned to factory.

RGC..M Mode of Operation (continued)

SSR Over Temperature:

The SSR is equipped with internal temperature monitoring to prevent SSR damage in case of overheating conditions. Upon detection of such a condition the SSR output is switched OFF and an alarm is issued accordingly. This alarm is visually indicated by the red LED which is fully ON. Once the temperature cools down, the alarm is cleared and if control is still ON an attempt to re-start the SSR is made.

Installation Instructions

Short Circuit Protection

Protection Co-ordination, Type 1 vs Type 2:

Type one protection implies that after a short circuit, the device under test will no longer be in a functioning state. In type 2 co-ordination the device under test will still be functional after the short circuit. In both cases, however the short circuit has to be interrupted. The fuse between enclosure and supply shall not open. The door or cover of the enclosure shall not be blown open. There shall be no damage to conductors or terminals and the conductors shall not separate from terminals. There shall be no breakage or cracking of insulating bases to the extent that the integrity of the mounting of live parts is impaired. Discharge of parts or any risk of fire shall not occur.

The product variants listed in the table hereunder are suitable for use on a circuit capable of delivering not more than 100,000A ms Symmetrical Amperes. 600Volts maximum when protected by fuses. Tests at 100,000A were performed with Class J fuses, fast acting; please refer to the tables below for maximum. Tests with Class J fuses are representative of Class CC fuses.

Co-ordination type 1 (UL508)

Part No.	Max. fuse size [A]	Class	Short circuit current [kArms]	Voltage [VAC]
RGC2..10	30	J or CC	100	Max. 600
